AI Introduction Homework 1

4112064214 侯竣奇

April 28, 2025

1 Summarize

This Jupyter notebook demonstrates a machine learning classification task using a car evaluation dataset.

- 1. Data Collection and Preparation:
 - Downloads car evaluation data from UCI Machine Learning Repository
 - Target variable 'class' is binarized (0 for 'unacc'/'acc', 1 for 'good'/'vgood')
 - Applies one-hot encoding to categorical features
- 2. Model Development
 - Uses Decision Tree Classifier with initial parameters:
 - criterion: entropy
 - max depth: 5
 - min_samples_split: 10
 - min_samples leaf: 4
 - random state: 42
- 3. Model Optimization
 - Implements GridSearchCV for hyperparameter tuning
 - Searches across multiple parameters
 - criterion: gini, entropy
 - max depth: 3-15
 - min_samples_split: 2-20
 - min samples leaf: 1-8
- 4. Performance Analysis
 - Evaluates model using
 - accuracy score
 - confusion matrix
 - classification report
 - Visualizes
 - Decision tree structure
 - Feature importance analysis through bar charts
- 5. Results
 - Successfully creates a binary classifier for car evaluation
 - Provides insights into which features are most important for car quality prediction
 - Demonstrates the effectiveness of decision trees for this classification task

2 Step 0: Download the data and save it locally

3 Step 1: Load and Preprocess the Data

3.1 Load the dataset

```
[66]: import pandas as pd
[67]: df = pd.read_csv("data/hw1.csv", header=None)
[68]: # column names according to http://archive.ics.uci.edu/dataset/19/car+evaluation
         buying: vhigh, high, med, low.
        maint: vhigh, high, med, low.
         doors: 2, 3, 4, 5, more.
      # persons: 2, 4, more.
      # lug_boot: small, med, big.
         safety: low, med, high.
     df.columns = ["buying", "maint", "doors", "persons", "lug_boot", "safety", [

¬"class"]

[69]: df.head()
[69]: buying maint doors persons lug_boot safety class

3.2 Data Cleaning and Transformation

使用 One-Hot Encoding 來處理 Categorical Data (可以直接使用 pandas 的 get_dummies)

```
1
             False
                          False
                                       False
                                                        True
                                                                    False
2
                                                        True
             False
                          False
                                       False
                                                                    False
3
             False
                          False
                                       False
                                                        True
                                                                    False
4
             False
                          False
                                       False
                                                        True
                                                                    False

4 Build a Decision Tree Classifier

4.1 Initialize the classifier

4.2 Train the model

```
[87]: model.fit(X_train, y_train)
```

[87]: DecisionTreeClassifier(criterion='entropy', max_depth=5, min_samples_leaf=4, min_samples_split=10, random_state=42)

4.3 Make predictions

```
[88]: y_pred = model.predict(X_test)
```

5 Step 3: Evaluate the Model

5.1 Evaluate performance

```
[89]: from sklearn.metrics import accuracy_score, confusion_matrix, □ ⇒classification_report
```

```
[90]: accuracy_score(y_test, y_pred)
```

[90]: 0.9393063583815029

```
[91]: confusion_matrix(y_test, y_pred)
```

```
[91]: array([[303, 15], [6, 22]])
```

confusion_matrix 顯示:* True Negative (TN): 303 (實際為 bad, 預測為 bad) * False Positive (FP): 15 (實際為 bad, 預測為 good) * False Negative (FN): 6 (實際為 good, 預測為 bad) * True Positive (TP): 22 (實際為 good, 預測為 good)

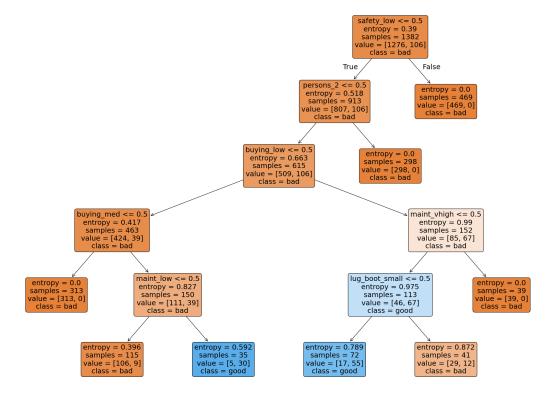

[92]: print(classification_report(y_test, y_pred))

	precision	recall	f1-score	${ t support}$
0	0.98	0.95	0.97	318
1	0.59	0.79	0.68	28
accuracy			0.94	346
macro avg	0.79	0.87	0.82	346
weighted avg	0.95	0.94	0.94	346

5.2 Visualize

```
[93]: import matplotlib.pyplot as plt
```

[94]: from sklearn.tree import plot_tree

6 Step 4: Hyperparameter Tuning

6.1 Tune hyperparameters

```
[96]: from sklearn.model_selection import GridSearchCV

[97]: param_grid = {
    "criterion": ["gini", "entropy"],
    "max_depth": [3, 5, 7, 9, 11, 13, 15],
    "min_samples_split": [2, 3, 5, 10, 15, 20],
```

```
"min_samples_leaf": [1, 2, 4, 6, 8],
      }
[98]: # 我們使用網格搜尋 (GridSearchCV) 來進行 hyperparameter 調整。
      grid_search = GridSearchCV(
          estimator=model,
          param_grid=param_grid,
          cv=5,
          scoring="accuracy",
          n_jobs=-1, # 使用所有 CPU 核心
      )
[99]: grid_search.fit(X_train, y_train)
[99]: GridSearchCV(cv=5,
                   estimator=DecisionTreeClassifier(criterion='entropy', max depth=5,
                                                    min samples leaf=4,
                                                    min_samples_split=10,
                                                    random state=42),
                   n_{jobs}=-1,
                   param_grid={'criterion': ['gini', 'entropy'],
                               'max_depth': [3, 5, 7, 9, 11, 13, 15],
                               'min_samples_leaf': [1, 2, 4, 6, 8],
                               'min_samples_split': [2, 3, 5, 10, 15, 20]},
                   scoring='accuracy')
      6.2 Evaluate the tuned model
[100]: print("最佳參數:")
      print(*grid_search.best_params_.items(), sep="\n", end="\n\n") # 換行輸出 dict
      print("最佳分數:", grid_search.best_score_)
      最佳參數:
      ('criterion', 'entropy')
      ('max_depth', 7)
      ('min_samples_leaf', 1)
      ('min_samples_split', 2)
      最佳分數: 0.9891435148851567
[101]: # 使用最佳的參數來預測
      best_model = grid_search.best_estimator_
      y_pred = best_model.predict(X_test)
[102]: print(classification_report(y_test, y_pred))
                                recall f1-score
                   precision
                                                   support
```

0	1.00	0.96	0.98	318
1	0.68	1.00	0.81	28
accuracy			0.96	346
macro avg	0.84	0.98	0.90	346
weighted avg	0.97	0.96	0.97	346

7 Step 5: Report Results

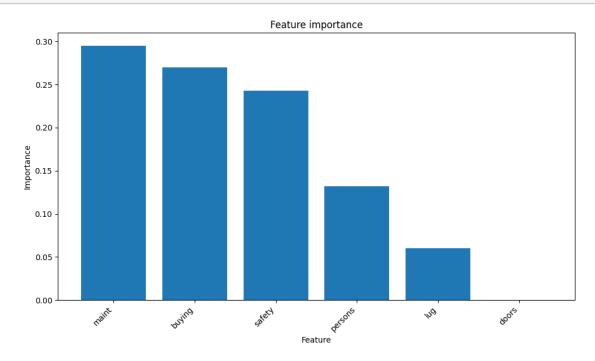

本次作業成功使用 Scikit-learn 的 DecisionTreeClassifier 對汽車評估資料集進行了二元分類 (good/bad)。

- 資料預處理: 我們對類別型特徵進行了 One-Hot Encoding, 並將目標變數映射為 0 和 1。
- 模型建立與評估: 初始決策樹模型在測試集上達到了約 94% 的準確率。
- Hyperparameter 調整: 透過 GridSearchCV 找到了更優的超參數組合 (criterion='entropy', max_depth=7, min_samples_leaf=1, min_samples_split=2), 將測試集準確率提升至98.9%。
- 特徵重要性: 分析顯示 maint 和 buying 是影響分類最重要的兩個特徵。

7.1 Bonus: Feature importance analysis

```
[103]: import matplotlib.pyplot as plt
[104]: # 由於我們做了 One-hot Encoding,需要把實際上相同的 Feature 總和在一起
      # 才能判斷在原資料中各個 Feature 的重要性
      feature_groups = {}
[105]: for feature, importance in zip(X_train.columns, best_model.
       ⇒feature importances ):
          original_feature = feature.split('_')[0]
          if original feature not in feature groups:
              feature_groups[original_feature] = 0
          feature_groups[original_feature] += importance
[106]: grouped_importance = pd.DataFrame({
          "feature": feature_groups.keys(),
          "importance": feature_groups.values()
      }).sort_values("importance", ascending=False) # 依重要度排序
[107]: # 視覺化
      plt.figure(figsize=(10, 6))
      plt.bar(grouped_importance["feature"], grouped_importance["importance"])
      plt.xticks(rotation=45, ha="right")
      plt.title("Feature importance")
      plt.xlabel("Feature")
      plt.ylabel("Importance")
```

plt.tight_layout()
plt.show()

根據 Feature importance 長條圖,可以看出 maint (維護成本) 是影響汽車分類最重要的特徵,其次 是 buying (購買價格)。safety (安全性) 和 persons (乘坐人數) 也有一定的影響力,而 lug_boot (行李箱大小) 和 doors (車門數) 的重要性相對較低。

這個結果符合直覺,通常購買價格、安全性、乘坐人數等因素會影響汽車的分類。

[]:
